

# Agentic AI

Generative AI is Reactive, meaning that it waits for the user to prompt, to give instructions for it to perform the instruction.

Whereas, AI Agent is proactive, starting with prompt and then taking actions with the Chain of thought reasoning.

## Terminology to understand the Agentic AI

- **Deterministic and the Probabilistic systems:**
  - **Deterministic system:** it always produce the same output for a given input, following the strict rule, logic, ensuring the predictable and repeatable results. This system is used in RPA (Robotic Processing Automation)
  - **Probabilistic system:** it operates on the likelihood rather than the fixed rules. it analyze the patterns and data to make predictions, the result may vary based on the probabilities. This system is used for the ML/AI system.

RPA = is the system that mimic the human's action on a computer. but it still fragile, we have to manually maintain it if something's gone wrong.

But when we combine the RPA with the ML --> Intelligent Automation or hyperautomation.
