

Chapter 13 _ The new world of work

Humic = uniquely human abilities.

The future belongs not to AI alone but to this powerful symphony of human and machine capabilities.

Level 1: repetitive tasks, required explicit programming

Level 2: handle more complex task but still in confined parameters

Level 3: understand context, reasoning, and orchestrating complex tasks.

Level 3 agents create categories of work.

The three Competencies of the future

- Change-ready: developing resilience and adaptability in the face of continuous transformation, Viewing change not as a threat but as an opportunity.
- AI-ready: this competency involves understanding how to work effectively with AI systems. This goes beyond the technical knowledge, it is about developing an intuitive sense of AI's capabilities and limitation.
- Human-ready competency: focuses on developing uniquely human capabilities that AI cannot authentically replicate--what we call humic

Humic

Critical thinking --> nuanced judgement, questions assumption, and navigates ethical complexities. Stay curious

Social authenticity --> the ability to build genuine human connections based on shared values

Creativity --> Novel ideas that are useful and meaningful to human and society and thus not simply the recombination of existing ideas.

Instead of trying to compete with it, i am trying to learn how to be humic

Humic development:

- Reflection and experimentation
- Recognize and reward the development of Humic-based skills
- Designing work process that optimize the collaboration between human humic and AI capabilities.

Reinventing Education in the Age of AI

We must return to first principles and redefine what it means to be educated in a world where humans and increasingly sophisticated AI agents collaborate as partners rather than competitor.

But in the world of Agentic AI, where AI agents can instantly access and process vast amounts of information, our educational priorities must shift dramatically.

School is meant to help people find their purpose and develop their full potential as human beings.

We must redesign assessment methods to evaluate human capabilities rather than memorized knowledge.
