

model_validate

It is a Pydantic V2 classmethod used to safely parse and validate dictionaries or objects into a strict Pydantic model instance.

It checks your data, applies type coercion, and raises a `ValidationError` if anything is incorrect.

```
from pydantic import BaseModel, ValidationError

class User(BaseModel):
    id: int
    name: str

data = {"id": 123, "name": "Alice"}

# Validating a dictionary
try:
    user = User.model_validate(data)
    print(user.name) # Alice
except ValidationError as e:
    print(e)
```
