

invoke and stream

use `invoke()` when you need to wait for and return the complete final output/response

Use `stream` to yield output chunks progressively, word-by-word, to improve user experience drastically.

```
from langchain_openai import ChatOpenAI

# Initialize the model
llm = ChatOpenAI(model="gpt-4o")

# 1. Using invoke()
response = llm.invoke("Write a haiku about coding.")
print(response.content)

# 2. Using stream()
for chunk in llm.stream("Write a haiku about coding."):
    print(chunk.content, end="", flush=True)
```
