

sys argv

So imagine, we have a python file named `greet.py`

```
import sys

# The first argument (index 1) is the user's name
name = sys.argv[1]
print(f"Hello, {name}!")
```

When running it in the terminal

```
python greet.py Alice
```

Output --> `Hello, Alice!`

When it truly shines

- For simple scripts, `sys.argv` is sufficient. However, for complex tools with flags (like `--help` or `--verbose`), the `argparse` module is the recommended standard because it handles parsing, data types, and help messages automatically
