

Function Dispatcher

It is a design pattern or system that dynamically select which function to execute based on specific input, condition, or identifier.

Agent with multiple tools

```
def call_function(name, args):  
    if name == "search_kb":  
        return search_kb(**args)  
    elif name == "calculator":  
        return calculator(**args)  
    elif name == "send_email":  
        return send_email(**args)
```

But a cleaner and more scalable approach look like this

```
TOOLS = {  
    "search_kb": search_kb,  
    "calculator": calculator,  
    "send_email": send_email  
}  
  
def call_function(name, args):  
    func = TOOLS.get(name)  
  
    if not func:  
        raise ValueError(f"Unknown tool: {name}")  
  
    return func(**args)
```
