

Dendrogram

A dendrogram is like a family tree for clusters. It shows how individual data points or groups of data merge. The bottom shows each data point as its own group, and as we move up, similar groups are combined.

The lower the merge point, the more similar the groups are. It helps us see how things are grouped step by step.

- At the bottom of the dendrogram the points P, Q, R, S and T are all separate.
- As we move up, the closest points are merged into a single group.
- The lines connecting the points show how they are progressively merged based on similarity.
- The height at which they are connected shows how similar the points are to each other; the shorter the line the more similar they are
