

Sandbox

Sandbox is a safe place that the agent can execute the code, do anything without affecting the real setting or causing irreversible damage

So we all know that the agent can do almost everything like write the code, call the api, read, execute the terminal code,... so you can't just let it do that in your device.

Types of Sandbox in the agent framework

1. **E2B (Most common)**

2. **Docker containers**

Your own sandboxed environment using the containers. Each Agent run gets a fresh container.

3. **Claude's Computer Use/Tool Sandbox**

When Claude uses tools like bash, file editor, or browser, Anthropic runs these inside a sandboxed VM so Claude can't touch the real host systems
