

Tool use and Hardcoded

Email Agent Example

Hardcoded (always happens automatically):

- Authenticating / connecting to the email account
- Loading the inbox on startup
- Logging every action for security

Tool Use (AI decides when to call):

- `search_emails(query)` — only if the user wants to find something
- `send_email(to, subject, body)` — only if the user wants to send
- `summarize_email(id)` — only if the user asks for a summary
- `delete_email(id)` — only if the user wants to delete

In tool use

We have to code 2 things:

1. The actual function

```
def search_emails(query): # actual code that connects to Gmail and searches
    return results
```

2. The tool definition: a description that tells the AI what the tool is and how to use it

```
{ "name": "search_emails", "description": "Search the user's inbox by keyword",
  "parameters": { "query": "the keyword to search for" } }
```
