

create_agent

`create_agent()` is the standard minimalistic primitive used to build custom agent harnesses. It replaces older methods like `create_react_agent`, providing an extensible model-and-tool loop built directly on top of LangGraph

It is the main function used to build an AI agent that can:

1. Think about a task
2. Decide whether it needs a tool
3. Call the appropriate tool
4. Read the tool's result
5. Continue reasoning
6. Return the final answer

Old

```
initialize_agent(...)
create_react_agent(...)
AgentExecutor(...)
```

Replace by `create_agent` which can build and manage the agent loop automatically.
