

typing - TypedDict

It allow us to specify a fixed schema for dictionaries, defining the exact keys and the types of their values.

This will bring the benefits of strict type checking like autocomplete and error catching.

```
from typing import TypedDict

class UserProfile(TypedDict):
    age: int
    name: str
    is_active: bool

user: UserProfile = {"name": "Johnny Cage", "age": 88, "is_active": False}
```
