

model_dump_json and model_dump

`model_dump(mode="json")` returns a Python dictionary

For example:

```
response.model_dump(mode="json")

# You get back a dict:
{
    "success": True,
    "query": "transformer attention",
    "results": [...],
    "response_metadata": {
        "timestamp": "2024-01-28T00:00:00+00:00", # datetime → string
        ...
    }
}
```

`model_dump_json` returns a string

For example:

```
response.model_dump_json()

# You get back a string:
'{"success": true, "query": "transformer attention", "results": [...], ...}'
```

So

If we need to pass another Python function, we can use `model_dump(mode="json")`

If we need to send over HTTP/Save to a file, we can use

`model_dump_json()`
